

ABSTRACT OF THE DISCLOSURE

5

The invention relates to a method of automatically tuning a loop-filter of a phase locked loop. The loop-filter includes a capacitance at an output of a charge pump of the phase locked loop, and the charge pump provides
10 current impulses to the loop-filter. In order to enable a simple tuning of the loop-filter, the method comprises adjusting the amplitude of the current impulses output by the charge pump essentially proportionally to the capacitance at the output of the charge pump. The
15 invention relates equally to a phase locked loop comprising means for realizing this method and to a unit comprising such a phase locked loop.
